ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida's Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

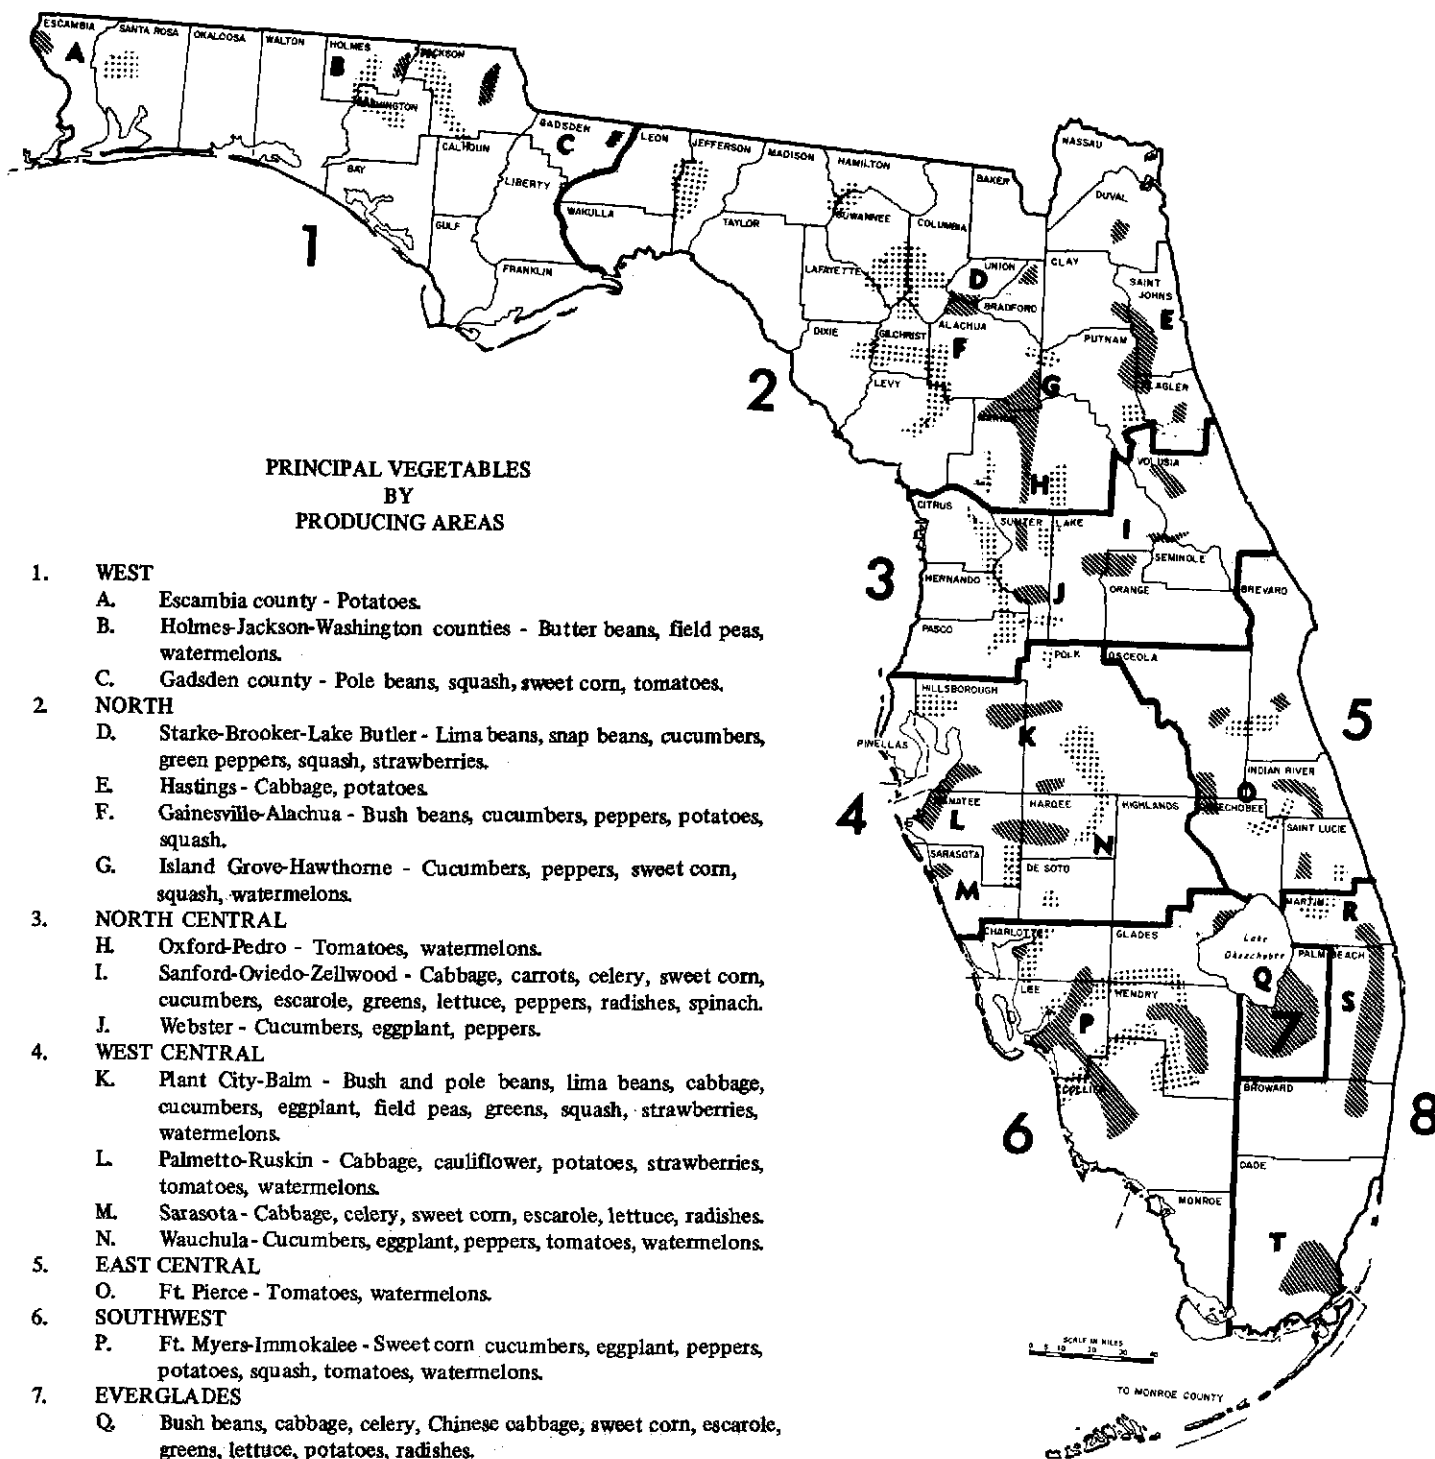

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; J. B. Joiner, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Harvey L. Batchelor, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News.

DEFINITIONS AND EXPLANATIONS

QUARTERLY GROUPS--During the growing season, estimates were prepared for most crops on a calendar quarter basis in order to indicate available supplies for shorter periods of time than the entire crop year. The Fall, Winter and Spring quarterly estimates are combined into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated quarter. Acreage lost and replanted to the same crop in time for harvest in the same quarter, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f. o. b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and

other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

Beginning with the 1977-78 crop season, all shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most Common Unit Estimated Net Weight, Number of Units per Hundredweight,
Principal Vegetable Commodities, Florida, 1977-78 Crop Season

SUMMARY OF THE 1977-78 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold totaled a record \$632.2 million, up \$71.6 million from the 1976-77 crop year. Acreage harvested increased 10 percent over the previous year when more acreage was lost from the January freeze. Crops showing the greatest gains in harvested acres were snap beans, sweet corn, eggplant, green peppers, tomatoes and "other vegetables". Crops increasing in value were snap beans, celery, sweet corn, cucumbers, eggplant, escarole, lettuce, green peppers, radishes, tomatoes, "other vegetables," watermelons and strawberries. Crops with lower values than the previous year were cabbage, potatoes, and squash. Most of the declines were due to lower season average prices. Tomatoes, which rose \$27.3 million, showed the greatest increase in value, followed by lettuce and snap beans which increased \$19.6 million and \$8.8 million, respectively. "Other" miscellaneous vegetables totaled \$61.2 million, an increase of \$8.5 million from a year ago. Most of the increase was due to gains in sales of cauliflower, sub-tropical vegetables and dry onions.

Average yields for celery, cucumbers, escarole, lettuce and green peppers increased during the year but yields declined for snap beans, cabbage, squash, sweet corn, eggplant, potatoes, radishes, tomatoes, watermelons and strawberries. Improved varieties, cultural practices and weather conditions can affect crop yields considerably.

Season average prices of snap beans, celery, sweet corn, escarole, lettuce, radishes, watermelons and strawberries were higher than a year earlier. Season average prices for cabbage, cucumbers, eggplant, green peppers, potatoes and squash were below a year ago.

Land preparation, planting and transplanting were very active in most areas of the state during July. Growing conditions were generally good to excellent over most of the farming areas during August. Planting activity progressed favorably. Heavy rains and cloudy skies made up the weather picture the first of September. A tropical depression dropped from 1 to 8 inches of rainfall over most farming areas before moving into the Gulf. Harvest gained momentum during October and November as rainfall was limited to a few light to moderate showers.

Temperatures during early December were mostly mild. A cold front entered the farming areas in mid and late December, lowering temperatures into the 30's on both occasions. The first front was accompanied by light, spotty frost and little or no damage occurred to vegetables. The last front caused light damage to tender foliage.

Much of January was characterized by temperatures in the low 30's. Light frost and cold winds caused light to moderate top foliage burn to tender crops. Precipitation was variable, ranging from a trace to less than an inch. Winds were generally light to moderate.

The month of February was dominated by cold weather and near freezing temperatures. Several cold fronts moved through the vegetable growing areas, dropping nighttime temperatures into the high 20's and low 30's. The adverse weather caused heavy foliage burn and some plant loss in late February.

Temperatures moderated in the farming areas in March. The weather was mostly warm and sunny. Rainfall was generally light to moderate. Frost damaged plants began putting on new growth as growing conditions were greatly improved.

The weather picture consisted of sunny days and mild nights throughout the month of April. Although several cold fronts passed through the vegetable growing areas, temperatures were only lowered slightly. Daytime highs were in the 80's with lows in the 60's and 70's at night. Crop conditions were generally good to excellent. Harvest was in full swing for some crops while others were declining seasonally.

Conditions were generally ideal during much of May. Below normal temperatures in some of the vegetable growing areas in late May set new records. Lows in the 50's were recorded but temperatures were quickly back to normal. Rainfall was variable, ranging from 1 to 4 inches. Harvest was very active for some vegetables while declining on others.

In June, the weather was generally normal over most of the vegetable growing areas. Moderate to heavy thundershowers occurred almost daily. Excess moisture caused some minor problems and delayed harvest. Daytime highs were mostly in the 90's with nighttime lows in the 70's. Winds were light to moderate, gusty near showers. Crops were generally fair to very good in most areas.

Most of the weather data for this summary was supplied through the National Weather Service, U. S. Department of Commerce, Ruskin, Florida. Information on effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1977-78

Florida growers produced nearly 4.0 million bushels of bush and pole beans during the 1977-78 season. Acreage harvested totaled 39,000 acres, up 32 percent from the 29,500 acres harvested during the previous season. The substantial increase is due to the freeze of January 18-20, 1977, which destroyed much of the winter acreage. The average yield for the 1977-78 season was 101 bushels per acre, as compared with 125 bushels per acre the previous year. The increase in harvested acres was enough to offset the decrease in yields.

The average f.o.b. price of \$8.06 per bushel was \$1.77 more than the previous year and reached an all time record high. Total value, at \$31.9 million, was 38 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with a small acreage grown in Gadsden and Marion counties and west central areas.

Earliest fall supplies of snap beans originate from West Florida. The north and west central areas, the Ever-

glades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from late September into mid June. The fall crop peaked in November, followed by a slight decline in marketings in December and a sharp drop in January and February. Production began to increase in March, and the spring crop peaked in April. Twenty-two percent of the marketings occurred in April, unchanged from April of the previous year.

Variable weather influenced last season's bean crop. Heavy rains in the Pompano area in early September delayed plantings as some fields were flooded. During the winter season, cold, brisk winds whipped plants, causing leaf damage and fruit scarring. Cold weather slowed maturity, resulting in lower volume. Some young plant loss occurred due to heavy frost. Weather during the spring season was mostly favorable. Strong winds at times caused light burn to foliage and some fruit scarring. Quality and yields were generally good to very good for the spring season.

CABBAGE
1977-78

Cabbage production in Florida totaled 6.5 million sacks and crates during the 1977-78 season. The gross value was \$29.9 million -- a decline of 38 percent from the record \$48.2 million set during the 1976-77 season. The average f.o.b. price was \$4.59 per sack and crate, down \$1.94 from the previous year's crop.

Acreage planted amounted to 17,700 acres, up nearly 4 percent from a year ago. Acreage harvested totaled 16,500, up 1 percent. However, total acreage abandoned, at 1,200 acres, was well above the 800 acres abandoned during the 1976-77 season. Yields were lower than the year before and averaged only 395 crates or sacks per acre. The average yield was the lowest since the 1970-71 season. The low yields are attributed partly to the small size of heads during the winter and most of the spring season. Also, excessive moisture during the winter months had an adverse effect on plant development.

Cabbage was available for market from November through June. Sales were about normal for the fall period but well below normal during the winter months. Volume sold during the spring period was slightly above average. The peak month was April followed closely by May while March, usually the peak month, fell to third.

The Hastings area, which includes Flagler, Putnam and St. Johns counties, is the largest producing area accounting for 56 percent of the state's total production, up slightly from last season. The north central area which includes Lake, Orange, Seminole and Volusia counties was second in production with 21 percent of the total. Average yields were lower than a year ago in all growing areas of the state.

Early transplanting and direct seeding were underway by late August and September. Transplanting was most active from October through December. Some acreage was lost during the winter months but most was replanted.

First cuttings were made in early November. Harvest increased rapidly until January when adverse weather slowed the development of plants. Wet, cold weather kept cabbage from sizing properly and there were a lot of small heads harvested. Volume was heavy through the spring but heads continued to be smaller than average. Spring shipments accounted for 45 percent of the total 1977-78 harvest, exceeding the winter volume by 1 percentage point.

CARROTS
1977-78

Production of carrots in Florida continued to gain during the year. There were 1,140,000 cwt. shipped out of state for both fresh use and processing. Fresh market use constituted 79 percent and processing 21 percent. Shipments were 18 percent above the previous year. This was due primarily to an increase in acreage in the Zellwood area. Carrots are not part of the regular estimates program, therefore, data on acreage and production are not published.

The muck soils around Lake Apopka, near Zellwood and the Everglades provide a good medium for growth. The mini or finger carrot harvest usually begins in late

October and is complete by the end of May. Regular size carrots are harvested from November through June. The peak harvest period last season was January to about mid May.

The young carrots are subject to cold damage in January and February in the Zellwood area. Some replanting was necessary last winter. Occasionally the tops of older carrots are "burned" by frost or cold winds but the crop grows out of it. With the exception of several cold periods, which lasted for only a few days, growing conditions were generally favorable. Quality was good throughout the season.

CELERY
1977-78

Florida celery marketings of 6.4 million crates were harvested from 10,900 acres during the 1977-78 growing season. The average yield of 588 crates per acre compares with 578 crates for the previous year.

Prices were improved over the previous season. Celery averaged \$7.36 f.o.b. per crate compared with \$6.70 in the 1976-77 season. Prices averaged lower for the fall and winter quarter but were above a year earlier for the heavy spring quarter. The crop was valued at \$47.2 million, an increase of 21 percent over the previous crop year.

The Everglades, with 84 percent of the harvested acreage, was the foremost area of production throughout the season. The north central area, supplemented by light volume from the Sarasota area, accounted for the remaining 16 percent of acreage and provided a continuous supply throughout the season.

Plant bed preparation and seeding were underway by early June. Transplanting became active in the Everglades and Zellwood around mid to late August and gained momentum as the season progressed. Planting in the Everglades continued into early April while some acreage in the north central district was still being seeded in late April. Growers in the Sarasota area planted mostly from October to March.

Light harvest began in early November in the Zellwood area and by mid November in the Everglades. Growing conditions were hot and humid in the summer and early fall. Cool weather in early November was beneficial. Growers were faced with a leaf miner problem and considerable spraying was necessary to bring it under control. Heavy stripping of outer stems and foliage was necessary.

Yields were reduced by stripping. Quality was variable for the fall crop but was greatly improved for the winter and spring crops. No significant damage from freezes occurred to celery during the season. Yields during the winter and spring quarters were considerably higher than a year earlier when that crop was hit hard by the late January freeze. The favorable spring market was welcomed by growers. Approximately 6 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality.

Celery production was most active December through May. Cutting declined seasonally in late May and June and was completed by July 1 in all areas.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Their field supervisors provide the basic acreage and production data. In cooperation with the committee, these data are assembled into weekly, monthly and annual reports.

CHINESE CABBAGE
1977-78

Chinese cabbage is grown primarily on the mucklands in the Zellwood and Everglades areas. The organic soils provide a good medium for rapid growth. Harvest was underway by mid November. Volume was light through November but increased to a good supply level in December and January. Production peaked in March and April. Good supplies were available from December to mid May.

During mid to late April, Zellwood was providing good supplies while the Everglades was tapering off seasonally. The season was over by mid June. Yields and quality were generally good throughout the growing season. The crop did not suffer significantly from cold weather or disease. Shipments for the season totaled 170,000 cwt., up 6 percent from a year earlier.

SWEET CORN 1977-78

Florida, the nation's leading sweet corn producer for fresh sales, marketed almost 12.7 million crates during the 1977-78 season. Production increased 6 percent from the previous year. Growers harvested 56,500 acres, up 12 percent from the 50,300 acres harvested during the 1976-77 season. Yields averaged 224 crates per acre statewide compared with 238 crates a year earlier. Yields have averaged above 200 crates per acre for every year since the record 244 crate average in the 1972-73 crop year.

The season average f. o. b. price of \$3.89 per crate was 20 cents above the average for the previous year. The total value of the crop was \$49.2 million, up \$5.1 million from the \$44.1 million received for the 1976-77 crop. The value of sweet corn ranked second in the state in vegetable crops and was exceeded only by the value of tomatoes.

First plantings of the season were underway in the Everglades in mid August. Seeding on the east coast got underway in late September and increased rapidly. Plantings were interrupted by adverse weather in late November in the east coast area. First harvest began in the Everglades in the week ended September 12th and reached a fall peak in late October. The declining harvest in the

Everglades during December was partially offset by harvest on the lower east coast and Dade County.

Harvest of the spring crop in the Everglades was underway by early April. The Everglades became the main source of supply in late April as the east coast and Dade County began to phase out. The transition of harvest from the Everglades to Zellwood occurred in mid May. Lake County provided a good volume in June. The season was complete in early July.

Small acreage provided supplemental supplies at Zellwood and the west central area during the early fall, and at Sarasota in the early spring.

Weather during the growing season was mostly favorable. Rain caused some minor problems to young corn during the early fall growing season. Cold weather in early January slowed growth and harvest in the lower east coast and Dade County. Frost and freezing temperatures in mid to late February destroyed considerable acreage of young corn in the Everglades. Conditions for the spring crop were very good. Quality and yields were good to excellent for most of the season.

CUCUMBERS 1977-78

Florida production of fresh market cucumbers during the 1977-78 crop year was over 4.4 million bushels, up 17 percent from the 1976-77 crop. The 16,500 acres planted was up 400 acres from the previous year and continued the upward trend started three years ago. Harvested acres totaled 15,800 compared with 15,000 harvested a year earlier. Average yield per acre, at 282 bushels, was up 29 bushels from the previous year. Total production was valued at \$22.4 million compared with \$19.7 million for the previous year. The f. o. b. price for 1977-78 averaged \$5.03 per bushel, down 16 cents from the average price of \$5.19 per bushel received for the previous year's crop.

Supplies in 1977-78 were generally available from September through June, with light marketings in January through March. Much of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 43 percent of the planted acreage during 1977-78, is the largest area. The west central area accounted for 28 percent of the planted acres in the state. The areas in the west, north central and southeast provide the remaining crop.

Weather during much of the growing season was generally favorable. Heavy rains during early fall caused only minor problems on young acreage. In early October, locally heavy rains washed beds and leached fertilizer in some fields. Cold, gusty winds in late November caused light to moderate leaf burn in unprotected fields. The weather from mid December to the end of the fall season was characterized by cold, gusty winds and frost. Conditions for the spring crop were mostly good although the season got off to a poor start due to adverse weather. Yields, size, quality and color were very good most of the season.

EGGPLANT
1977-78

Plantings of 2,400 acres were 7 percent above the 1976-77 season. Yields averaged 660 bushels per acre, 41 bushels below the previous season. Weather was generally very favorable during much of the growing season with the exception of the winter season. However, during early December, plant maturity and fruit set were reduced by adverse weather. Poor market conditions caused some abandonment of older fields. In mid February, below normal temperatures and frost slowed maturity and fruit set and caused considerable bloom droppage. Growing conditions during the spring quarter were very good but plant size was smaller than normal. Poor pollination and small fruit size reduced packout. Quality and fruit set were excellent but fruit size was small.

Production of eggplant increased to 1.5 million bushels, slightly above last year's production. Total sales increased to \$5.6 million compared with \$5.3 million a year earlier. The increase was due to a greater production which offset the slightly lower price per bushel. The season average price of \$3.80 per bushel is 10 cents lower than a year ago. The spring crop was higher in price than a year earlier but the fall and winter crops were much lower.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April and reached a peak in June. Harvest was virtually complete by early July. The southeast area around Pompano continued to dominate with 60 percent of the harvested acreage. The northern and central areas combined contributed 32 percent of acreage harvested with the remaining small acreage in the southwest.

Production is generally continuous through the entire crop year in the southeast and southwest, while the crops in western, northern and central areas are for fall and spring harvest only. Those areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas and then moved back northward in the spring.

ESCAROLE-ENDIVE
1977-78

Production of escarole and endive during the 1977-78 season totaled 3.3 million crates, up .2 million crates from a year ago. The 6,100 acres harvested was up 100 acres from the previous season. Yields per acre averaged 535 crates compared with 513 crates the previous year.

Prices during the season averaged \$4.63 per crate, compared with \$4.07 a year earlier. The total value of sales, at \$15.1 million, was 21 percent above the previous year and a new record high.

The Everglades, which had 73 percent of the harvested acreage in the 1977-78 season, began seeding in mid September. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through early June. The muck-

lands around Zellwood provided good volume in the late spring months. The smaller acreage grown on Lake Placid and Sarasota mucklands also furnished supplemental supplies during much of the season.

Sales started relatively slow in October but increased considerably to a good volume by November. Marketings reached peak levels in March. Good volume continued into May. Harvest declined seasonally and was over by mid June.

Growing conditions were generally favorable during most of the season. During late January and early February, frost caused some minor tip and leaf burn to the growing crop. Some stripping was necessary later in the season. Quality of escarole and endive was mostly good throughout the season.

LETTUCE 1977-78

Florida lettuce growers produced a record 2.0 million hundredweight during the 1977-78 season. This was 37 percent above the previous season. A 5 percent increase in acreage along with an increase of 44 cwt. per acre contributed to the record production. Average yield of 195 cwt. per acre compares with 151 cwt. per acre for the previous season. The season average f.o.b. price of \$19.09 per cwt. was \$6.75 above the average for the previous season. Prices were well above the previous year for all quarters.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb and leaf types. The Everglades muckland accounted for 84 percent of the planted acreage and was the source of a continuous supply which began in late October and ended in early June. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway by early September. All areas were actively planting by the end of the month. The Everglades and Sarasota areas had continuous plantings through March.

Harvest was underway by late October with light volume to mid November. Volume of all types increased in late November and December, with growers cutting in most areas. The Everglades provided the bulk of the volume during the winter period. Supplies peaked in April and then declined seasonally until harvest was completed in early June. Supplies from the Zellwood area are light during the winter months. Moderate volume is available from this area in the fall and spring.

Growing conditions during the early fall were hot and humid. Growth was generally very good. December rains caused some problems. Frost killed some young acreage in January in the Zellwood area. Some replanting was necessary. Volume gained rapidly in March and April. Quality was good.

PEPPERS 1977-78

During the 1977-78 season, Florida produced 8.2 million bushels of peppers, a record high, from 18,800 acres. The average yield of 434 bushels per acre was 9 percent above the 400 bushels the previous year. Production was 21 percent above the previous year.

The season average f.o.b price of \$5.17 per bushel was down from an average of \$5.66 for the previous year. The total value of \$42.2 million was 11 percent above the previous year. Prices were generally good during the winter period. Marketings were light in October but increased to a good level by December. Supplies decreased during the winter months and began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

The 3 percent decrease in total planted acreage was the result of a 6 percent drop in the heavy producing southwest area, a 12 percent decrease in the west central area and a 7 percent decrease in the north. Increases in the north central and southeast areas were not enough to offset these decreases. The southwest accounted for 59 percent of the state's total pepper acreage. The southeast had 19 percent; the north central area, 9 percent; the north, 7 percent; and the west central area, 6 percent.

Heavy rains during early September leached fertilizer and caused some light flooding. Spot resetting was necessary in some fields. Fields with plastic generally come through in better condition. Freezing temperatures and heavy frost during the winter months caused extensive top foliage burn and some young plant loss. Growing conditions were generally very good during the spring period. Yields were good to very good.

POTATOES
1977-78

Production of potatoes in 1978, including both the winter and spring seasons, totaled 5.7 million hundred-weight, down 9 percent from the year before. A total of 32,800 acres were planted during the year, compared with 30,500 acres planted in 1977. Of this total, 32,300 acres were harvested, 7 percent more than the previous year. The value of the crop was \$35.2 million, down 16 percent from 1977.

The average yield was only 175 cwt. per acre, well below the record high yield in 1977 of 206 cwt. per acre. The winter crop averaged 195 cwt., 15 cwt. above the freeze damaged crop of 1977. The spring yields were down sharply from the year before. The spring acreage grown in the Hastings area, which includes Flagler, Putnam and St. Johns counties, averaged only 170 cwt., well below the 1977 record yield of 220 cwt. per acre. Spring potatoes grown in all other areas of the state averaged only 125 cwt. per acre, the lowest since 1971.

The 1978 season average price of \$6.21 per cwt. was 50 cents less than the average received in 1977. Lower prices received in May and June kept the season aver-

age price down.

The "red-skinned" varieties continue to dominate the winter crop grown in south Florida. Production from the winter crop is used primarily for table stock. The "white-skinned" varieties grown in the spring in the Hastings area are used mostly in making potato chips. However, some red varieties are grown in the spring and packed for table stock sales.

Harvest of the winter potato crop extended over a longer period of time than usual. Digging was underway in early January and was not completed until early May. The spring crop grown in the Hastings area and other areas was damaged by excessive moisture during the growing season. This caused a sharp reduction in yield and slightly lower quality. Planting of the spring crop was completed on time. Rain and cold kept the crop from developing properly. Harvest got underway in April and progressed rapidly to the May peak and was completed by the last week in June. May continued to be the heavy shipping month.

RADISHES
1977-78

In 1977-78, radish plantings amounted to 32,000 acres compared with 31,000 planted the previous year. Acres harvested totaled 28,200, a record high, compared with 27,300 in 1976-77. Yield per acre averaged 287 cartons compared with 291 cartons the previous season. The crop was valued at \$22.2 million, up 36 percent from a year earlier and an all time record high. The average f.o.b. price was \$2.74 per carton, up 68 cents from the previous year.

A good supply of both red and white radishes was

available from Zellwood, Lake Placid and the Everglades from October through May with a light volume going into June. The fall peak harvest occurred in November and held the same level throughout December. The spring peak occurred in April. Seeding of the 1977-78 crop was underway in the Everglades and north central areas in early September. Some early fields received too much rain. Light harvest was underway in late September and became quite active in mid November. Supplemental supplies were available from Lake Placid and Sarasota during the year.

SPINACH FOR PROCESSING
1977-78

Spinach statistics have not been published separately for Florida in recent years in order to avoid disclosure of individual operations. However, data for these seasons have been included in "other vegetables" in the overall summary table. This historical series is being maintained for this report with the anticipation that clearance

may be possible for future publication of data. Also, data for historical years are published in order to show the relative importance of this crop. Yield per acre was above a year earlier. Growing season was generally favorable. Most of the crop is grown in north central and north areas.

SQUASH 1977-78

Florida's production of squash during the 1977-78 season, at 1.7 million bushels, is .2 million bushels below last year's record high. Harvested acreage totaling 11,850 acres, decreased 1 percent from the previous year. The yield at 143 bushels per acre was down 15 bushels from the previous year.

The average f.o.b. price of \$4.28 per bushel was down \$1.61 from last season. Total f.o.b. cash receipts amounted to about \$7.3 million. Prices were generally favorable throughout the season.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white and zucchini squash. Dade County with 30 percent of the state's harvested acreage in 1977-78, produces yellow crookneck almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter

months. The southwest produces a continuous supply of most types. Central, north and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are usually light and confined mostly to local markets. The 1977-78 season got off to a fair to good start as rains caused some minor problems. Marketings increased to a fall peak in November and early December, before showing a seasonal decline during the winter months. Cold winds in late November and early December caused light to moderate foliage burn. During the winter months, January through March, cold temperatures and frost slowed growth and caused extensive foliage burn and plant kill to both old and young crops. Weather was favorable during the spring quarter, and production was heavy. Peak marketings for the season occurred in May.

STRAWBERRIES 1977-78

Florida strawberry growers produced 2.8 million flats of berries during the 1977-78 season, up 33 percent from the previous year. Harvested acreage totaling 2,000 acres also increased 33 percent from a year earlier. The increase in acreage more than offset the slight decline in yield per acre. The average f.o.b. return per flat for the season was \$5.88, up \$1.67 from the previous season. The value of the crop was a record \$16.6 million, up sharply from the \$9.0 million received for the crop a year ago.

Laying of plastic and other field work was in full swing by late September in the Plant City and Dade County areas. Transplanting began by early October and was

completed by early December. Transplantings were completed in Bradford County by late November. Light harvest was underway by mid December in the Plant City and Dade areas. Early harvested berries were primarily for local use and roadside stands. Light shipments began in January and reached a peak in March. Most of the commercial harvest was completed by late April and growers opened fields to the public for u-pic operations. Crop progress was good in the November and December growing period. Cold and rains in January and February slowed maturity and reduced fruit quality. By mid March, quality and size were very good. Peak volume was reached by the third week of March. First harvest was underway in Bradford County by early April and the season was drawing to a close by mid May.

TOMATOES 1977-78

The total value of the Florida tomato crop for fresh and processing utilization increased from last season. The \$182.3 million was 18 percent above the previous season and a record value. The main factor contributing to the increase was more acres harvested - up 22 percent from a year earlier.

Total production of 30.1 million 30-pound carton equivalents was 18 percent above the previous season. The fresh market channel utilized 95 percent of the production and the remaining 5 percent was for processing. The Palmetto-Ruskin area accounted for 40.8 percent of the production; Dade County, 20.0 percent; the southwest, 26.1 percent and the Ft. Pierce-Pompano area, 10.5 percent. The remainder of the production was in the west, north, and north central areas.

The state average yield, at 688 (30-pound) cartons per acre, was down 24 cartons from the previous season. This decrease was due in part to hot weather causing heavy bloom bud and open bloom dropage which in effect lowered yields. Dade County supplies the bulk of winter tomatoes. Fall shipments peaked in December, which accounted for 16.0 percent of the season's market sales. Spring production reached a peak in May, which amounted to 29.3

percent of the season's total. Tomatoes are usually harvested continuously from late October to mid June.

The Palmetto-Ruskin area continued to be the acreage leader, with 14,950 acres harvested. Dade County ranked second, harvesting 10,750 acres. The southwest harvested 9,800 acres, and the Ft. Pierce-Pompano area, 4,400 acres. There were 1,600 acres harvested in the north, north central, and west areas, 45 percent more than last year. Most of this increase in acreage was in Gadsden County.

Seeding and transplanting were underway in all areas in August. Heavy rains in early September delayed plantings, washed beds, damaged young seedlings in low areas and leached fertilizer in some fields. Damage was minimal. Mostly favorable weather prevailed throughout the remainder of the fall season. During the winter season, cold winds and heavy frost mid to late February caused extensive foliage burn and some young plant loss. Weather conditions were generally favorable for the spring season, although there was some light fruit scarring in late April. In mid May, locally heavy showers damaged plants in low spots in the Palmetto-Ruskin area. Some growers were unable to pick as many times as normal due to poor market conditions.

WATERMELONS 1977-78

Watermelon acreage planted during the 1977-78 season totaled 59,000 acres--down 9 percent from the previous season. Of the total acres planted, 50,000 acres were harvested, 2 percent less than 1977. The crop of 8 million hundredweight was down 10 percent from the year before and the lowest production since the 1973-74 season. The average yield for the state was 160 cwt., 15 cwt. less than a year ago. The average yields varied considerably by areas with the Panhandle averaging only 90 cwt. per acre and the southwest averaging 206 cwt. per acre.

The value of the crop totaled \$26.8 million, 1 percent more than last season. The average price received by growers was nearly 3.4 cents per pound compared to nearly 3 cents received in 1977. Higher prices in the southern growing areas helped to offset the lower price received in the north and west.

The watermelon harvest season usually begins in the Ft. Myers-Immokalee areas in late March and early April, depending on late winter and early spring weather. The season progresses northward into the central areas during May and the northern areas of the state provide the heavy June volume. Harvest begins in the western counties in June and continues into July.

First plantings were made in the Immokalee area by late December. Periodic cold fronts passing through

the state during January and February caused acreage losses, delayed seed germination, and poor plant development. Reseeding and spot replanting was necessary before stands were obtained. The first melons did not move from the area until early May.

Planting was active in the north and west by mid March. Cold weather and wet soils slowed planting, seed germination and plant development. Stands were skippy in many fields.

Harvest was underway in the central areas by late May and in the north by mid June. Volume increased rapidly into June with all areas, except the west, shipping during the early part of the month. Harvest in June accounted for 72 percent of the state's total watermelon production in 1978.

Light harvest was underway by late June in the Panhandle. More than half the acreage planted was abandoned in the western counties because of poor market conditions and dry weather in some areas. Average yield for the Panhandle was only 90 cwt. compared to 100 cwt. per acre the year before. Many fields were picked only once which kept the yield low. By the last half of July the season was practically over except for a few local sales.

OTHER CROPS
1977-78

Cantaloups are grown primarily in the southwest and north central areas of Florida. A considerable proportion of the production is sold through local markets and roadside stands. The peak harvest period is May and June. Harvest begins in the southwest and moves northward as the season progresses.

Acreage remains at a relatively low level. However, this crop is not part of the regular estimates program. Researchers are working to develop several new varieties that will be better adapted to Florida's soil and climate. There appears to be some promise that acreage may expand at sometime in the future.

Cauliflower is expanding in the Zellwood, Hillsborough, and Everglades areas. Supplies are available from November through April. There has been a renewed interest in cauliflower production recently. At the present time statistics are not for publication. Shipment data for the 1978-79 season are now being published by the Market News Service.

Sub-tropical vegetable production increased from the previous season. Most acreage is grown in Dade County. Commercial production began in the early 60's. Sub-tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by its scientific name is listed below. Other common terms for the various vegetables are shown in parentheses. The crops consist primarily of boniatos-ipomea batatos (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma sagittaeifolium (dasheen, yautias); and yuca-monihot esculenta (sweet cassava). Miami is an important point of consumption for the Florida production. Also, considerable amounts are shipped to Tampa, New York City and Philadelphia.

Collard, turnip, mustard and other greens are grown for both fresh market and processing markets. These crops are grown throughout the state and centered around the large population areas and in the muck soils of

the Everglades and Zellwood areas. Good volume is available November through May with the peak shipping period occurring January through March. Shipments totaled 140,000 cwt. during the 1977-78 season compared with 82,000 cwt. shipped a year earlier.

Okra is grown in many areas of the state during the warm seasons of the year. However, Dade County produces okra for local use as well as for shipments to out-of-state markets. Good volume occurs October through July with peak movement in May and June.

Green onions and leeks are produced in the north central areas. Supplies are marketed primarily at local markets. Supplies of dry onions have been increasing for the past several years. Most of the dry onion production is concentrated in the Everglades, southwest and west central areas.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and the Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available September through December. Heavy movement occurs during the April through June period, especially in northwest Florida. A high percentage of the crop goes for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics will be available for the 1978-79 season.

Watercress is available the year round. The major source of supply is Oviedo. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially the Sanford market.
